Lecture => 5

→ console.log (b.toFixed(number));

→ number to which we want approx value after decimal

it will copy the original number and return new string

→ return type is string but type of original remain same

b.toPrecision(number); → we get no. of number we get

→ return string

b.toString(); → convert into string

// new keyword

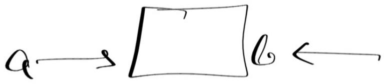
let a = new Number(20); → X not to use

let b = new Number(20);

console.log(a==b); // false

because a and b are object

Note console.log(a==b); // true only when



a and b refer to same object

Math → It is inbuild object which provide mathematical properties and methods

Math.random() → generate random number b/w [0 , 1)

↓ 0 included

↓ 1 excluded

//how to generate random variable (ourself)

let num = 2340; → let num = device_time

sqrt(num)

↓

1239 multiply

↓

cube

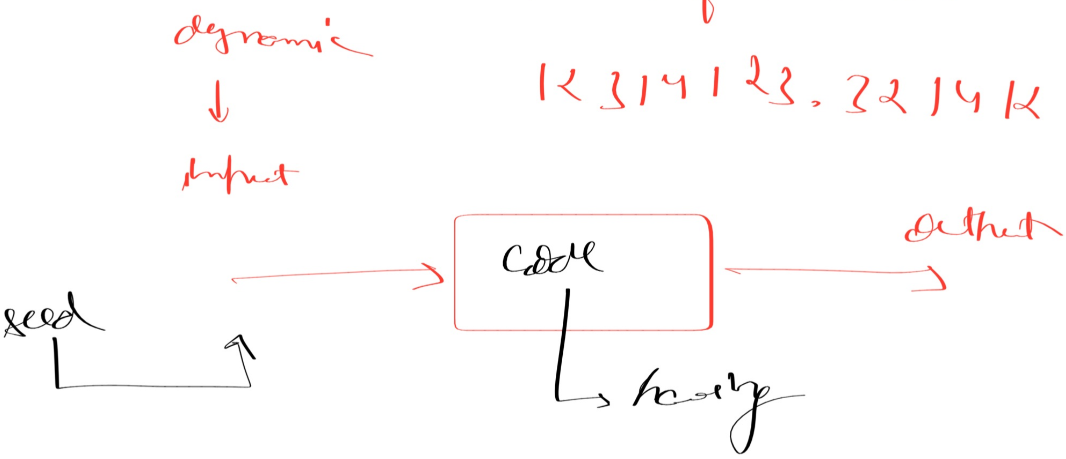
↓

1000000 divide

↓

return after decimal value

12314123.3214124742|



So seed can be same with hacker
as seed is the time value
and if seed is set then it become
easy to crack password
