Lecture 311 Closure

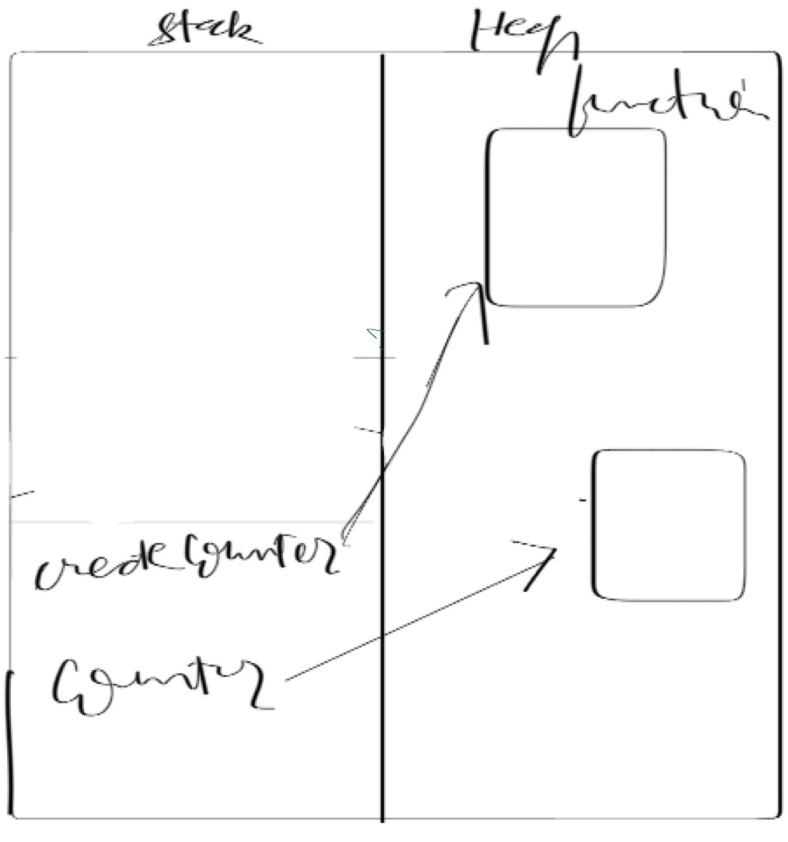

```
function createFunction(){
    let count = 0;
    function increment(){
        count++;
        console.log(count);
        console.log("I am increment function");
    }
    return increment;
}

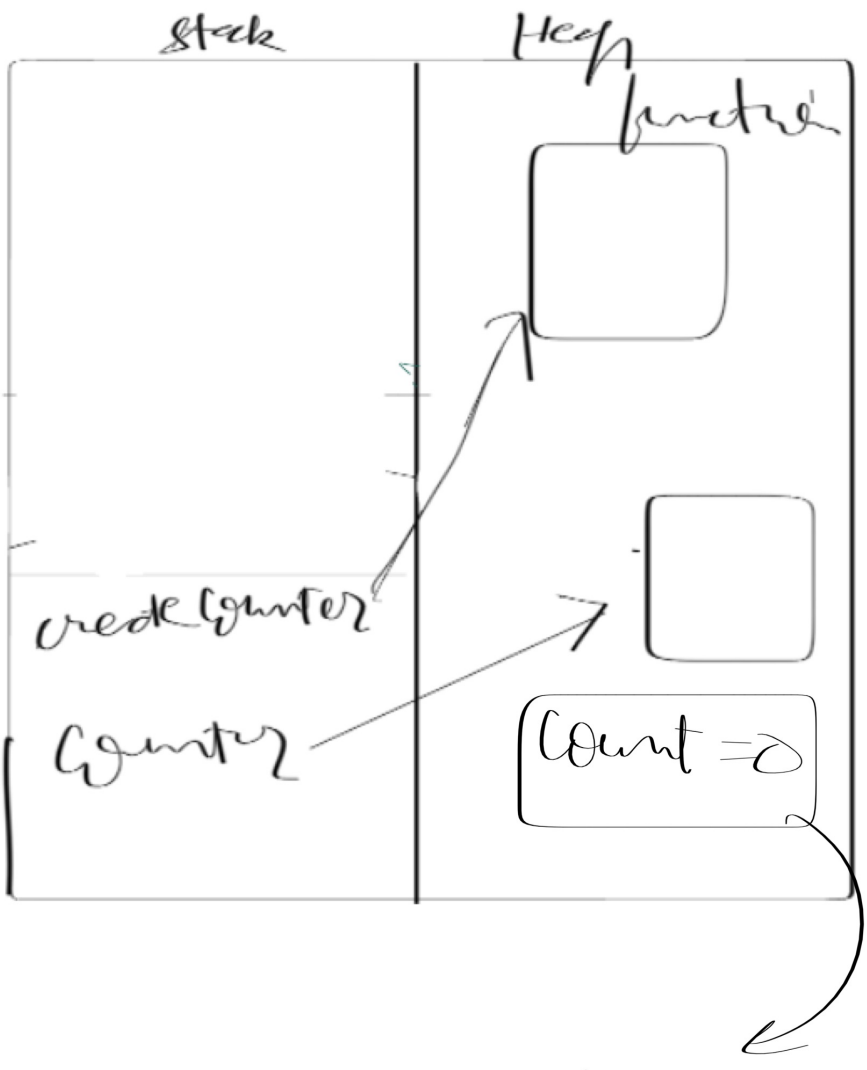

const counter = createFunction();
console.log(counter());
console.log(counter());
console.log(counter());
counter();
```

→ After that it got deleted

It moved from stack to heap area

A closure is that function that remembers variables from its outer scope even after the outer function has finished executing
