

JAVASCRIPT

Lecture 7

Note ⇒ Our Browser can only understand javascript code.
`console.log("Hello world")`

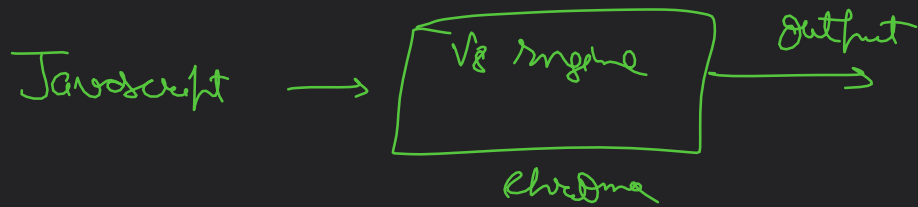

⇒ Why Javascript is used instead of C++, C, Java

① ease of learning for web developers
as C++ coders are limited
and not easy language to start with

② as C++ is low level language which
can control our memory so it is
not good for security purposes.

③ In C++ we have to manually

alloc memory and delete memory but
in JS garbage collector

What is V8 engine?

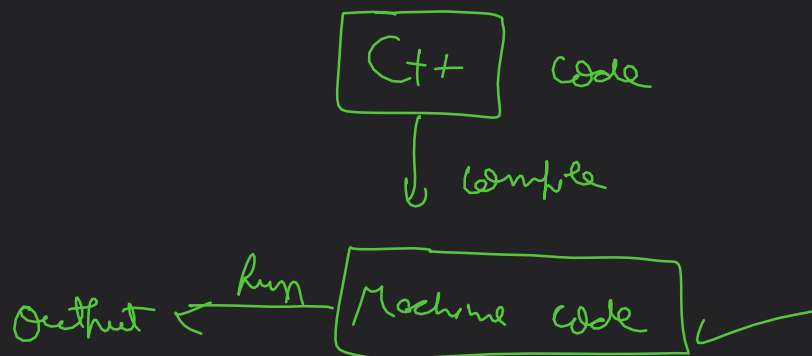

↓
code of C++

Then how C++ can understand
JavaScript code and give
output?

⇒ But does C++ has compiler?

NO compiler is not present in
chrome

⇒ Then How code run?

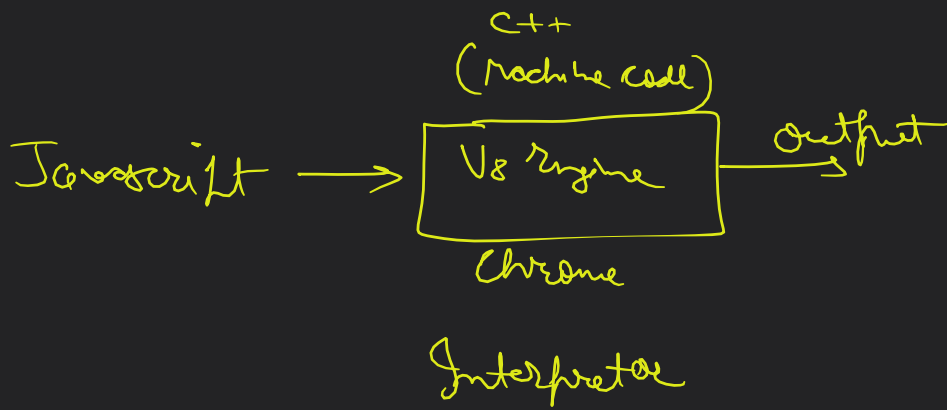

So [V8 engine is written in machine code]

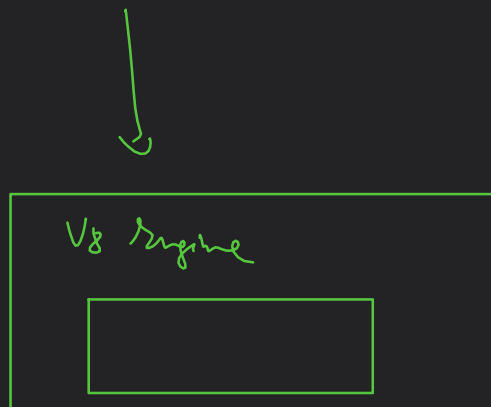

as OS (Operating System) can understand

machine code

so we do not need compiler

V8 engine

Node.js → runtime javascript environment
↳ provide environment in
which we can run code
On our system.
